

STAIR DE-ICING PANELS

INSTALLATION GUIDELINES

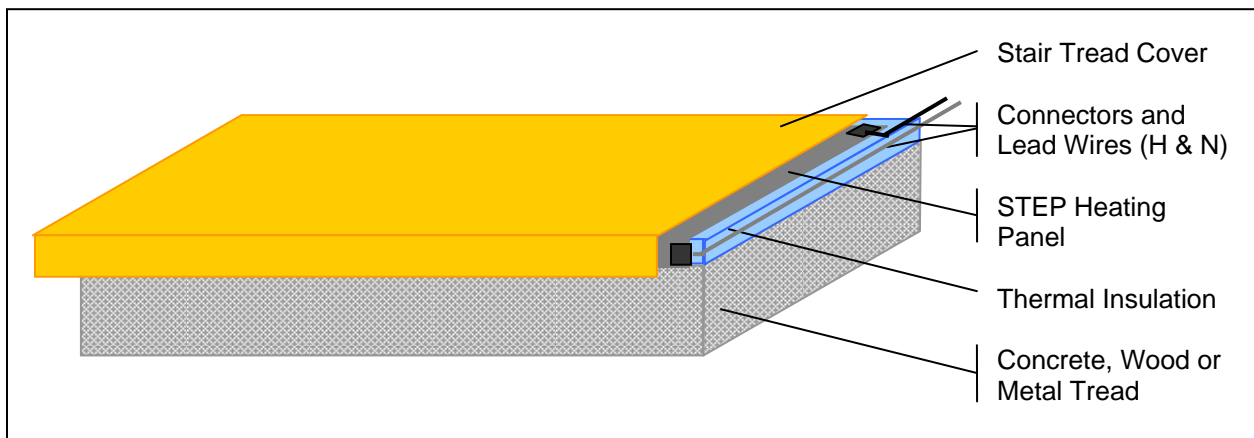

Stair tread covers are a convenient way to add STEP Stair De-icing™ panels and provide a solid footing for existing treads.

STEP Stair De-icing™ panels may be installed over structurally sound wood, concrete or metal treads. It is extremely important to have proper thermal insulation, e.g. Styrofoam or equivalent, under the heating elements.

STEP Stair De-icing™ panels can be curved at the nosing area. Attach the panels to the insulation with tape or adhesive.

DO NOT PENETRATE the panels with fasteners as this may create a short circuit and/or allow humidity to penetrate in the vinyl protection.

To create a flat surface, make grooves in the insulation material to accommodate the connectors and lead wires.
